Ble bort percentage of users should be admitted dynamically, and the admission threshold duration 2δ is increased. Preferably, a separate admission threshold is maintained for each particular video at a value such that the average startup latency for statically admitted users is about equal to the average startup latency for dynamically admitted users. Methodology for so maintaining the threshold by automatic adjustment is discussed further below. Similarly, the artificial minimum wait Wmin in the dynamic allocation may be adjusted automatically so that as the system becomes busier, the minimum wait Wmin is increased.
